ABSTRACT. The catalogue presents information on the valid Silurian stratigraphic units and their stratotypes (establishing time, author, location, publication) established in Estonia and Latvia. Altogether the catalogue includes 78 stratigraphic units, among them 10 regional stages, 23 formations, 28 beds, 16 members and one group. The geographical etymons and the transliteration of the names of stratigraphic units into English, Estonian, Latvian and Russian are given.

Key-words: Silurian, stratigraphic units, stratotypes, Estonia, Latvia.

PREFACE

The catalogue presents information on the Silurian stratigraphic units and their type sections (stratotypes) established and currently used in Estonia and Latvia. Data on the units, having stratotypes in Lithuania, will be published separately.

Earlier type sections were not formally fixed by stratigraphers. In such case the locality, on which the geographical name of a unit is based, is treated as the historic stratotype.

Altogether the catalogue includes 78 stratigraphic units, among them 10 regional stages, 23 formations, 28 beds, 16 members and one group. All stratotypes distinguished in the Silurian of Estonia and Latvia until now are unit-stratotypes. The stratotypes are represented by outcrops as well as drill core sections. In some cases stratotype outcrops have been doubled by drill cores in order to extend the stratigraphic interval exposed in the stratotype area. The stratotype cores are stored in five core depositories. Two depositories belong to the Institute of Geology, Estonian Academy of Sciences. One of them is situated in NE Estonia at Püssi Field Station, the other in Central Estonia at Särghaua Field Station. The core depository in Keila town near Tallinn belongs to the Estonian Geological Survey. In Latvia the most important depositories of Katlakalns and Skrunda belong to the Latvian Geological Survey. Katlakalns is a southeastern suburb of Riga; Skrunda town is situated on Kurzeme Peninsula.

The location of the stratotypes is shown in Figures 1 (Estonia) and 2 (Latvia). The locality numbers on the schematic maps correspond to those used in Table 1. Numbers in brackets show destroyed or otherwise unrepresentative sections, replaced by neostratotypes.

The mutual position of the stratigraphic units and their relations to the regional chronostratigraphic standard are shown in the correlation chart (Fig.3).

The most general data on the stratigraphic units and stratotypes are recorded in Table 1. The names of the units are given in their original spelling using diacritical marks of the Estonian and Latvian languages respectively, but their order in the table corresponds to the English alphabet and does not take into account diacritical marks.

The column "Establishing of the unit" contains the year of establishing, author(s), reference(s), and the original rank of the unit if it differs from the currently used one. Data on the stratotypes include the place name, the outcrop type, depth interval of the stratotype section in drill core and the name of a core depository. The column "Location of the stratotype or neostratotype" gives a rough orientation for using the locality maps (Figs 1 and 2). Districts named after towns or larger settlements do not coincide strictly with the formal administrative units.

Table 2 shows derivation of the names of the stratigraphic units and their transliteration into different languages.

In the tables the following abbreviations (besides the most common ones) have been used:

anc. - ancient	isl. - island
B-s - beds	ls - lectostratotype
C - central	Mb. - member
dep. - core depository	ns - neostratotype
distr. - district	penins. - peninsula
Fm. - formation	set. - settlement
harb. - harbour	str. - stronghold
hs - hypostratotype	vil. - village

Acknowledgements. - Dr. L. Gailite supplied the compiler with data on the Silurian stratotypes in Latvia and added transliteration of the stratigraphic names into Latvian. Mrs. A. Noor assisted by editing of the catalogue, Dr. P. Männik helped in producing the tables and Mrs. K. Ronk prepared the illustrations. It is pleasure to thank them for their contribution.

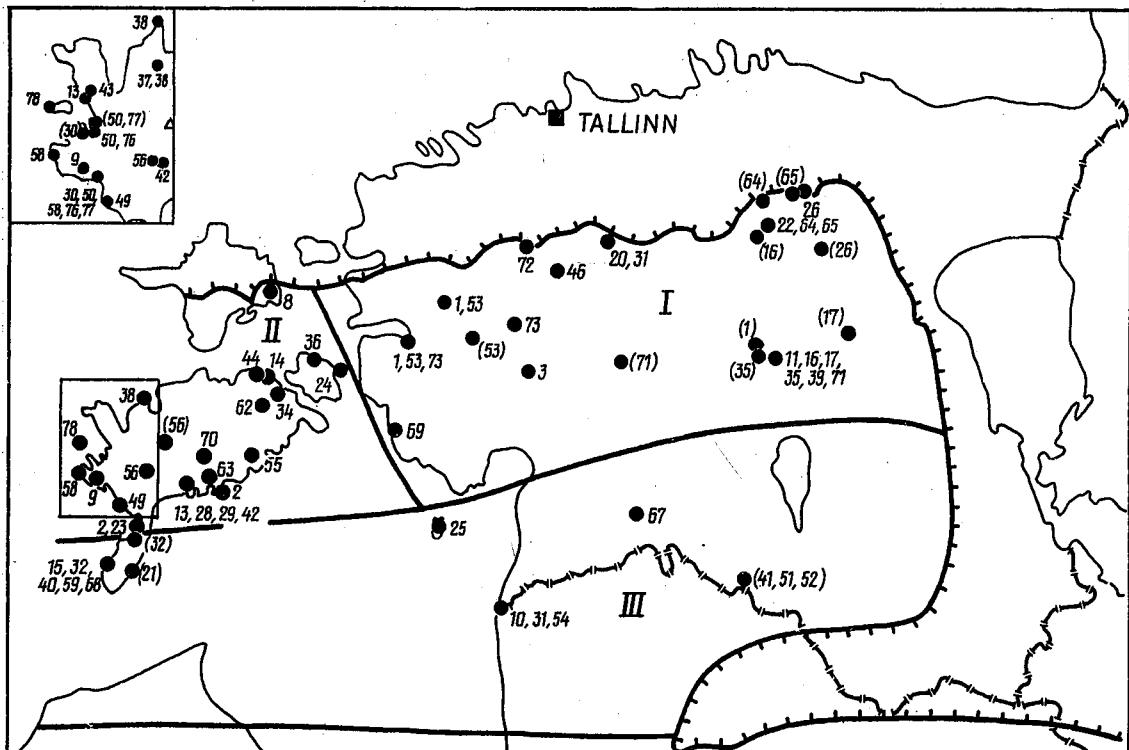

Fig. 1. Locality map of the Silurian stratotype sections in Estonia. Locality numbers on the map correspond to those in Table 1. Numbers in brackets denote the destroyed or unrepresentative localities. I - Central and West Estonia, II - West-Estonian Islands, III - South Estonia, North Latvia, Sörve Peninsula.

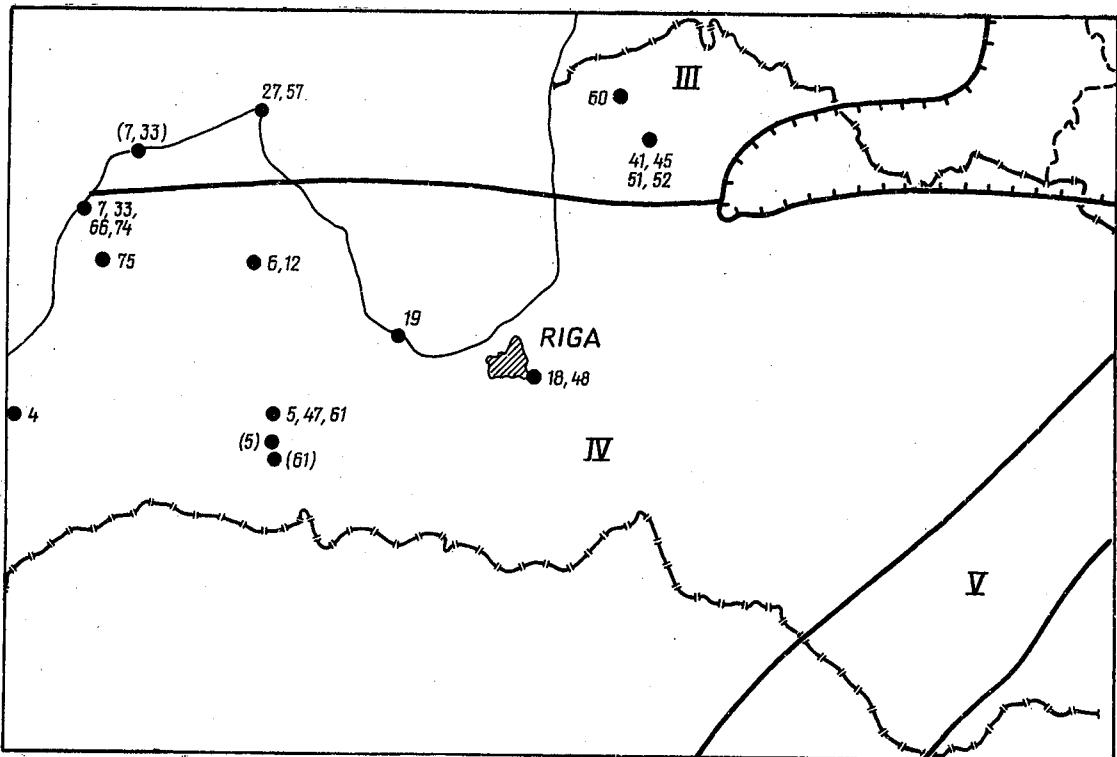

Fig. 2. Locality map of the Silurian stratotype sections in Latvia. Locality numbers on the map correspond to those in Table 1. Numbers in brackets denote the destroyed stratotype drill cores. III - South Estonia, North Latvia, Sõrve Peninsula, IV - Central, West and South Latvia, V - East Latvia and Lithuania.

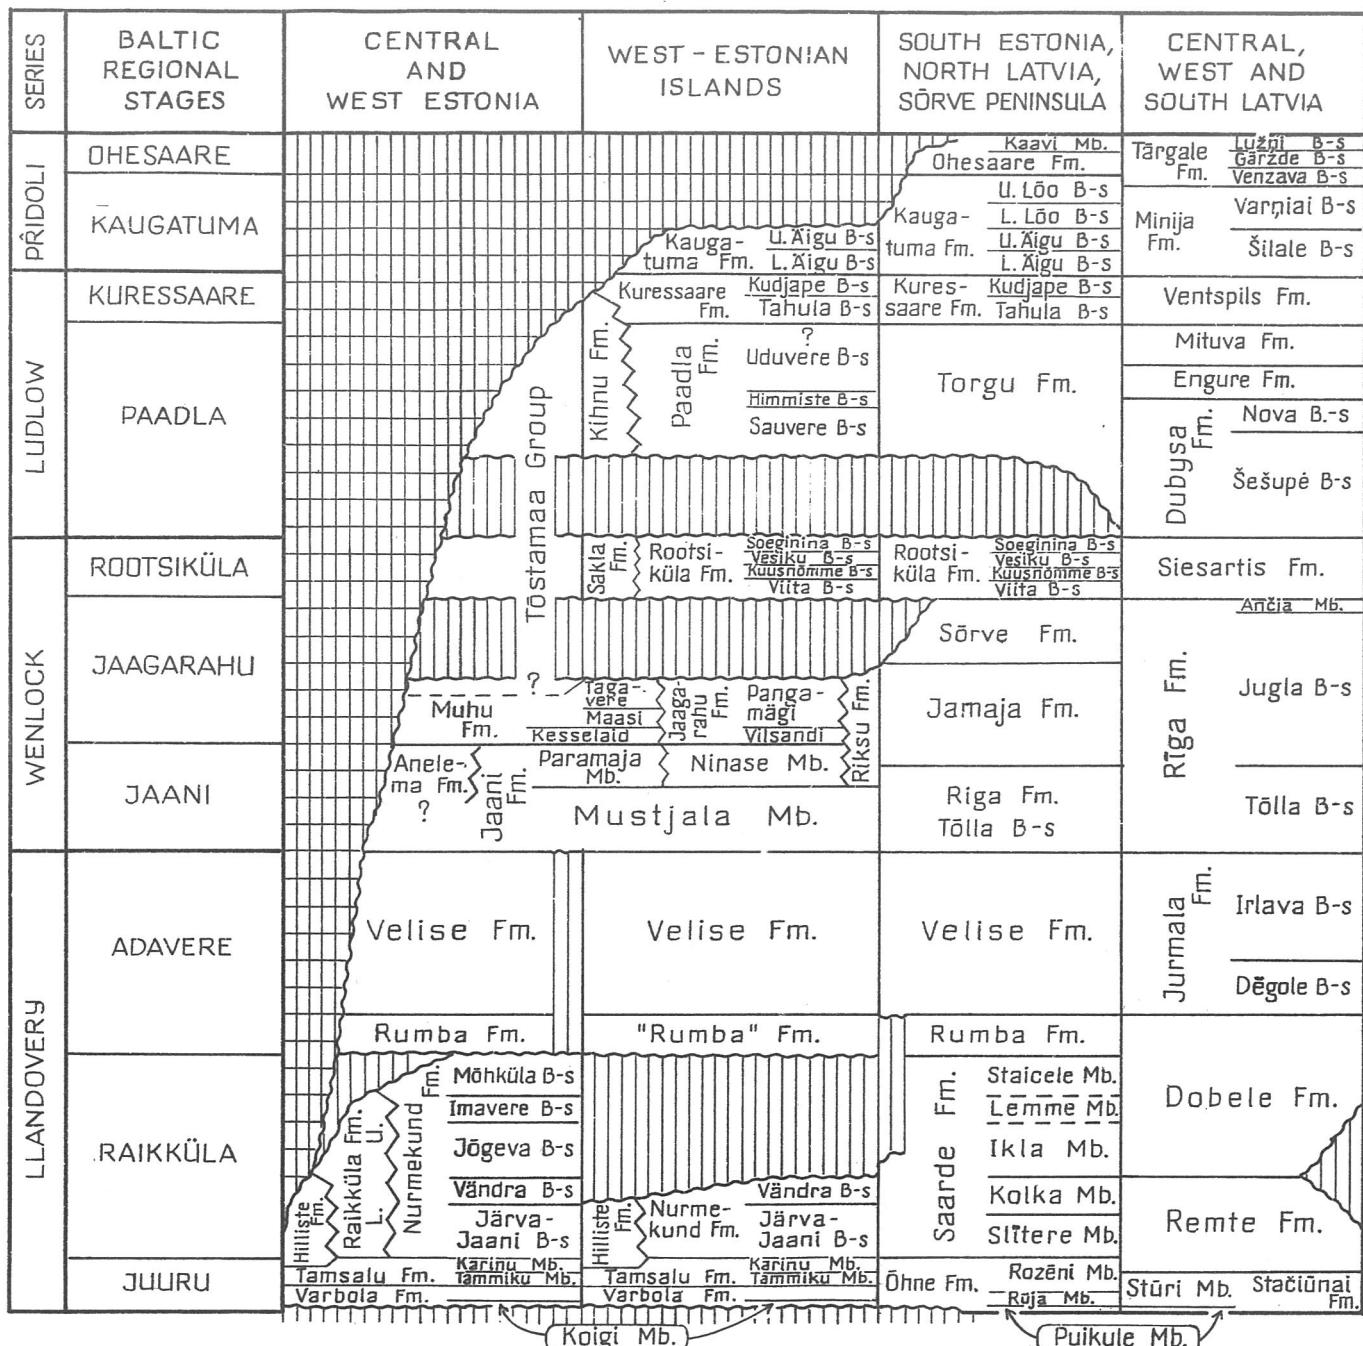

Fig. 3. Correlation of Silurian stratigraphic units in Estonia and Latvia.

Table 1

SILURIAN STRATIGRAPHIC UNITS and STRATOTYPES in ESTONIA and LATVIA

No	Stratigraphic unit	Establishing of the unit	Original or historical stratotype	Location of the stratotype or neostратotype	Neostratotype (ns) and/or hypostratotype (hs)	Publications
